Providing all your pest facts

Earwig

Earwigs get their name from an old myth, it states that if you slept on the ground an earwig would crawl into your ear, lay their eggs and tunnel into your brain causing you to go insane.

Did you know that there are nearly 2,000 species of earwigs across the world? They can be found all over the world and have a lifespan of 1-3 years. Earwigs reach adulthood in just 20 days and the females are unusually maternal for an insect staying with the hatched infants until they are about to feed and defend themselves.
